

## **Group Project: Flint Banking**

Flint Banking is a mobile app that is focused on providing an easy-to-use platform for all your financial needs, especially when it comes to saving money to secure your financial future. When a user creates an account, they will be able to create a checking and/or savings account and will have the ability to withdraw, deposit, and transfer funds instantly with no hassle or delay. Additionally, Flint will provide a snapshot of the user's financial health as it relates to their saving and budgeting goals.

Digital banking for a digital world. This is where Flint shines. With Flint, you can carry your bank with you wherever you go and access your funds anytime, anywhere and anyplace. Let us be the spark that lights your financial fire. We'll handle planning, management and tracking so you can focus on building wealth. Let us do the math while you lay the path.

Our MVP will allow a user to create accounts, delete accounts, transfer funds, and send funds to other users. Additional features in the product pipeline include a stock investment vehicle and financial news.

We will create this project using MySQL, Java, Spring Boot, JHipster, and a React front end.
